# INTERFACE VALIDATION CHECKLIST

The interface specification document should describe a solution to be developed. To ensure the proposed solution meets stakeholder requirements and fits business goals, use the following checklist:

- All main and alternate flows are covered

- Correct terminology is used

- Correct data types, formats, default values, and validation rules are used

- Error handling is included in the design

- Localization requirements are met

- Specific usability requirements are met

- Information security requirements are met and data access is granted according to user roles and privileges

- Quality attributes for the interface (such as availability, reliability, and performance) are considered

- Design standards and guidelines provide principles and best practices for creating a consistent solution

- Design standards and guidelines are properly applied
